Research:

1997	<p>Research Assistant Norman Kreisman Department of Physiology and Neuroscience Program SL-39, Tulane University School of Medicine, 1430 Tulane Avenue, New Orleans, LA 70112, USA.</p> <p>We investigated volume regulation in hippocampal slices maintained in an interface chamber and exposed to hypo-osmotic medium. Relative changes in intracellular and extracellular volume were measured respectively as changes in light transmittance and extracellular resistance. We hypothesized that the relatively low incidence of RVD was related to depletion of taurine, an osmolyte known to play an important role in volume regulation, during preparation of the slices. The results indicate a critical role for cellular taurine during hypo-osmotic volume regulation in hippocampal slices. Inconsistencies between optical measurements of cellular volume changes and electrical measurements of extracellular space are likely to result from the complex nature of light transmittance in the interface slice preparation.</p> <p>Taurine enhances volume regulation in hippocampal slices swollen osmotically.
